NNR Global Logistics Materiality

SDGs

Contribute to a decarbonized society throughout the supply chain

In order to transition to a decarbonized society, it is essential to reduce emissions in the logistics sector, which emits a large amount of greenhouse gases at each stage of the logistics process. NNR Global Logistics Division aims to decarbonize the entire supply chain in collaboration with domestic and overseas partners.

Providing high quality and safe services

NNR Global Logistics Division's key role is to ensure the safe and reliable delivery of our customers' goods without compromising their value. We are striving to improve our international logistics services to meet the ever-increasing need for such services due to the globalization of society.

Innovation in Logistics Services through DX

The logistics industry faces many challenges in Japan alone, such as dealing with the driver shortage and improving efficiency. To solve these issues, we will provide new value to our customers by enhancing internal and external operational efficiency and optimizing logistics through digitalization, as well as by upgrading our services using digital technology.

Respect for all human rights

We will avoid causing or contributing to negative human rights impacts and will address such impacts when they occur. We will also strive to prevent or mitigate negative human rights impacts directly linked to our global international logistics operations and business relationships.

Creating an inclusive workplace where diverse human resources can engage in active roles

The services provided by NNR Global Logistics Division, which operates globally, require diversity in terms of nationality and race, as well as flexibility to meet diverse needs. We aim to secure and foster employees with such a diverse mindset and backbone, as well as to create a workplace where each individual can utilize his/her strengths and cooperate with each other.

Promotion of fair and honest business activities

We aim to improve compliance (including information security) controls and global-based sustainability initiatives, including at overseas locations.
